

Quick Start: Deploy to Vercel

Prerequisites

- Git repository pushed to GitHub
- Firebase project credentials
- Vercel account (free)

5-Minute Deployment

Step 1: Install Vercel CLI

```
npm install -g vercel
```

Step 2: Login to Vercel

```
vercel login
```

Step 3: Deploy

```
cd "/Users/pranav/User Files/ASU/Internship/QR Code again"
vercel
```

Follow the prompts:

- **Set up and deploy?** Y
- **Which scope?** Select your account
- **Link to existing project?** N
- **Project name?** qr-restaurant-ordering
- **In which directory is your code located?** ./
- **Want to override settings?** Y
 - **Build Command:** cd frontend && npm install && npm run build
 - **Output Directory:** frontend/dist
 - **Development Command:** cd frontend && npm run dev

Step 4: Add Environment Variables

Get your Firebase credentials from Firebase Console → Project Settings → General

```
vercel env add VITE_FIREBASE_API_KEY
# Paste your API key when prompted

vercel env add VITE_FIREBASE_AUTH_DOMAIN
# Paste your auth domain

vercel env add VITE_FIREBASE_PROJECT_ID
# Paste your project ID
```

```
vercel env add VITE_FIREBASE_STORAGE_BUCKET
# Paste your storage bucket

vercel env add VITE_FIREBASE_MESSAGING_SENDER_ID
# Paste your sender ID

vercel env add VITE_FIREBASE_APP_ID
# Paste your app ID
```

For each variable, select:

- **Environment:** Production, Preview, Development (select all 3)

Step 5: Deploy to Production

```
vercel --prod
```

Step 6: Get Your URL

Vercel will output your production URL:

✅ Production: <https://qr-restaurant-ordering.vercel.app>

Step 7: Update QR Codes

1. Visit <https://your-url.vercel.app/admin>
2. Login with admin credentials
3. Go to "QR Codes" page
4. Download QR codes for all tables
5. Print and place at tables

Alternative: Deploy via Vercel Dashboard

Step 1: Push to GitHub

```
git add .
git commit -m "Prepare for Vercel deployment"
git push origin main
```

Step 2: Import to Vercel

1. Go to <https://vercel.com/new>
2. Click "Import Git Repository"
3. Select your repository
4. Configure:
 - **Framework Preset:** Vite
 - **Root Directory:** ./
 - **Build Command:** `cd frontend && npm install && npm run build`
 - **Output Directory:** frontend/dist

Step 3: Add Environment Variables

In Vercel Dashboard:

1. Go to Project Settings → Environment Variables
2. Add each Firebase variable
3. Select all environments (Production, Preview, Development)

Step 4: Deploy

Click "Deploy" button

Testing Your Deployment

Test Customer Flow

1. Open your Vercel URL on mobile: `https://your-url.vercel.app`
2. Navigate to `/signup?tableId=test`
3. Enter customer details
4. Browse menu and place test order

Test Admin Flow

1. Open `https://your-url.vercel.app/admin`
2. Login with admin credentials
3. Check Kitchen page for test order
4. Verify Live Bills page
5. Download QR codes

Troubleshooting

Build Fails

Error: Cannot find module 'vite' **Solution:** Ensure `package.json` has all dependencies

Environment Variables Not Working

Error: Firebase: Error (auth/invalid-api-key) **Solution:**

1. Check variables are set in Vercel Dashboard
2. Ensure variable names start with `VITE_`
3. Redeploy after adding variables

404 on Routes

Error: Refreshing page shows 404 **Solution:** Ensure `vercel.json` has rewrites configured (already done)

Continuous Deployment

Once set up, every push to GitHub automatically deploys:

```
# Make changes
git add .
git commit -m "Update menu"
git push origin main
```

```
# Vercel automatically builds and deploys!
```

Next Steps

✅ Deployment complete! ✅ Test thoroughly ✅ Generate QR codes ✅ Print and laminate QR codes ✅
Place at tables ✅ Train staff on admin panel ✅ Launch! 🚀

Support

- Vercel Docs: <https://vercel.com/docs>
- Firebase Docs: <https://firebase.google.com/docs>
- Your deployment logs: <https://vercel.com/dashboard>

Your app is now live and accessible from any device! 🚀
